### 1979-2004 SEAT TRACK EXTENSION KIT

#### PARTS LIST

##### **(2) SEAT TRACK EXTENSION BARS**

**(2) 10mm LOCK NUTS**

**(2) 10mm x 30mm BOLTS**

The seat track extension kit may be used for either the driver's side seat or the passenger side seat. One kit will only modify one seat. This kit is designed to relocate the coupe seat position back 4 ½" and raise it about ½". Convertible is about 3" back and raise ½" over stock. The convertible's seat relocation is limited by interference with the cars seat belt assembly. Be careful as to not relocate the seat too far back as damage may occur to the seat belt assembly. The seat track extenders will make your rear seat unusable due to the lack of leg room. Rear floor mats may have to be trimmed to fit application.

#### INSTALLATION

- 1) Remove the seat you wish to install the extension kit on. This is done by sliding the seat all the way forward and removing the two 15mm bolts that hold the rear of each seat track to the floorboard. These are located under a plastic cover which is removed by gently prying out the push in type fasteners.
- 2) Now slide the seat all the way back and remove the front two 15mm bolts that hold the front seat tracks to the floorboard.
- 3) If you car is equipped with power seats you must now tilt the seat back and disconnect the power seat harness.
- 4) Carefully remove the seat from the car.
- 5) Place one seat track bar on each front stud. Use the original hardware to bolt the bars to the floorboard. Tighten securely at this time.
- 6) Now place your seat on the newly installed seat track bars. Use the new hardware supplied in kit and tighten. If you have power seats, re-connect the harness.

**WE ASSUME NO LIABILITY FOR DAMAGE, INJURY OR DEATH  
RESULTING FROM THE INSTALLATION OF THIS PRODUCT.**
